TITLE: Mounting Embedded Parts by the Smooth-Joint Method

PERIODICAL: V sb.: Energ. str-vo, Nr 2, M.-L., 1958, pp 39-45

ABSTRACT: The problems associated with the mounting of gate embedded parts, advantages and disadvantages of both smooth- and dented-joint methods are considered. For the case of a smooth-joint placement, when the embedded parts cannot be reliably steadied, structures are suggested that permit adjusting the position of the embedded parts after concrete placing. A slot structure consisting of slabs with embedded parts adjusted after the concrete placing is described.

TITLE: Crystals of Pyrrhotite From the Vishnevye Gory
(Mountains) in the Urals (Kristally pirrotina iz
Vishnevykh gor na Urale)

PERIODICAL: Tr. Sverdl. gorn. in-ta, 1956, Nr 26, pp 113-115

ABSTRACT: In the Vishnevye Mountains of the Urals small pyrrho-
tite crystals have been found in districts where mia-
skites and aegerine-augite syenites have suffered
strong carbonate alteration. Most of the crystals are
tabular; the others are barrel-shaped. The following
crystallographic forms have been recognized: $c\{0001\}$
(predominant in the tabular variety), $m\{10\bar{1}0\}$, $t\{10\bar{1}4\}$,
 $S\{10\bar{1}2\}$, $r\{10\bar{1}1\}$, $u\{20\bar{2}1\}$, and $A\{5052\}$.

✓ Determination of the volume increase of a mineral by its metamict disintegration B. V. Chesnokov (V. V. Vakh-rushev Mining Inst., Sverdlovsk), *Zapiski Vostochnykh Mineral. Obshchestva* 85, 580 (1952). *J. Paleont. Am. Mineralogist* 37, 137-57 (1952).—The metamict conversion of a mineral of the pyrochlore group is indicated by a very characteristic increase in vol. (measured at 25°, 54 and 75°) and by strong neck, strains and other changes in the surrounding minerals. Pyrochlore crystals are recrystallized

during in a metastable condition, and form a kind of pyromatite. The structure of the metamict mineral is indicated by the crystallographic data, forming typical crystal marks, while in the case of the surrounding minerals, a great deformation is observed, indicated by a characteristic form, and displacement of the scaly mineral. The process of recrystallization of the metamict pyrochlore is indicated by exothermic effects at 58°-60°, and at 615-25° on the differential-thermal curves, combined with a considerable increase in d. in the recrystallized mineral. Investigation of the limits of explosiveness of turpentine vapor-air mixture. F. A. Chesnokov. *Izv. Vsesoyuzn. Nauch. Issledovatel. Rabot. No. 4, 1951, 191-192.* Tests were conducted with an electrically heated steel cylinder (388 cc) equipped with a spark plug for igniting the turpentine vapor-air mixture and a valve for reducing the pressure to atm. Content of turpentine in the mixture ranged from 0.0 to 1.0% by vol. The plug was sparked at temps. ranging up to 100° and with pressures at atm. or higher. The limits of explosiveness were 1.16-2.43% by vol. of turpentine in the mixture, this compares with 1.1-2.2% by vol. calculated on the basis of vol. of O₂ required for complete combustion. In fat works, while the air is not yet expelled, the drier the fat the slower will be the expulsion of the air and the greater the danger of the formation of an explosive mixture. Important safety measures are the blowing of steam through the unit at the start of the distill. or the addition of water after the unit has been heated up. B. Z. K.

Separation of camphene from the vapor-air mixture of the vacuum line in the production of camphor. P. A. Chernokov, Arkhangel, Leningrad, Inst. im. V. I. Lenin, Serovsk Nauch.-Issledovatel. Rabot 1960, No. 6, 101-3 (in Russian).--In rectification of camphene (at 50°) under 150 mm., the outgoing air contains about 150 g. camphene per cu. m. Subsequent condensation at 20° permits recovery of about 70% of the camphene.

About 80% of the balance can be recovered by absorption in solar oil, preferably freed from its volatile components (8%) by preliminary flushing with steam. With 0.2-0.5 kg. solar oil per cu. m. of air, 0-4 absorber plates are sufficient; with 2 kg. oil/cu. m., one plate is enough. In description, the expenditure of steam per 100 kg. solar oil, at 100, 120, 130 and 140°, is 100, 50, 40 and 30 kg., resp. Total recovery of camphene is about 94%. N. Thon

4
SOV/6055

clinical course, therapy, and outcome of infected cranial and cerebral injuries in subjects affected by penetrating radiation. Special features of the clinical phenomena and diagnostics of cerebral injuries and complications due to intracranial infection in acute radiation sickness are dealt with, and results of surgical and several kinds of antibiotic therapy are given. Basic methods for the use of antibiotics are presented. In the experiments, cranial and cerebral injuries were infected by cultures of suppurative infection-producing agents, bone splinters were left in the wounds, and primary surgical treatment was delayed for three days after irradiation and injury. Even under these conditions, satisfactory therapeutic results were obtained. The experiments indicate the desirability of extending the indications for the use of primary blind sutures [pervichnykh glukhikh shvov]. This investigation of cranial and cerebral injuries combined with radiation effects was conducted at the Academy of Military Medicine of the Order of Lenin imeni S. M. Kirov by a collective of authors under the leadership of Doctor of Medical Sciences N. N. Aleksandrov. There are 850 references: 579 Soviet, 219 English, 29 German, 20 French, 1 Italian, 1 Swedish, and 1 Hungarian.

TITLE: Automatic Assembly Welding in Manufacture of Electronic Equipment (Avtomaticheskaya svarka montazha pri izgotovlenii radioapparatury)

PERIODICAL: Tr. Gos. tsentr. n.-i. in-ta tekhnol. i organiz. proiz-va, 1957, Nr 1(5), pp 3-45

ABSTRACT: The author examines existing methods of assembling electronic circuits and components. It is shown that the employment of automatic carbon-arc welding (W) is possible and that the method is both reliable and economical. A saving of approximately 3.4 million rubles in wages will be achieved if 15% of wiring connections, required for the manufacture of apparatus in accordance with the 1960-plan, are executed with the aid of automatic W. A novel method proposed for wiring of circuits involves flash W of contact terminals by means of a carbon arc with a vibrating electrode. Technical specifications are given for the specialized equipment employed (ADSM-1 and KDSM-2 units developed by TsNIITOP) which

Card 1/2

SOV/137-58-10-21145

Automatic Assembly Welding in Manufacture of Electronic Equipment

· makes it possible to mechanize the W process and organize production-line methods of assembling various component units of radio apparatus. A conveyor employed in W is described. Data obtained during operations involving conveyor-W of switch segments of PTP-1 switches reveal an 85-percent reduction in the amount of work required for this operation. It is noted that the quality of W is highly consistent. Component units most suited technologically for automatic W are analyzed and the practical value of the employment of engineering processes and apparatus which had been developed is stressed.

Supercooled Solutions

Orig Pub : Sb. nauch. rabot. Białorus. politekhn. in-ta, 1956, vyp. 55, 136-145

Abstract : The temperature curve of a linear velocity of crystallization of sajol placed in a constant electric field of intensity on the order of 10^4 volt/cm, shifts towards the higher temperatures. The cause of the shift must be considered to be the increase in the activation energy of the molecules of the solution. The effect of an alternating electric field on the linear speed of crystallization manifests itself in a shift of the temperature curve towards lower temperatures. The shift depends on the frequency. The effect is caused by the reduced activation energy of the molecules of the solution and by an increase in the specific perimetric energy at the crystal-solution boundary. At audio frequencies and at electric field intensities on the order of 10^4 volt/cm, both

SUBJECT: USSR/Mining

127-10-13/24

AUTHORS: Mel'nikov, N.V., Corresponding Member, USSR Academy of Sciences;
and Chesnokov, M.M. Candidate of Technical Sciences.

TITLE: Safety Problems in Open Mines (Voprosy besopasnosti na otkry-
tykh rasrabortkakh)

PERIODICAL: Gornyy Zhurnal, 1957, #10, pp 56-60 (USSR)

ABSTRACT: The author analyzes statistics of traumatic injuries in mines
of some western countries and states that the number of acci-
dents in open mines is considerably lower than in underground
mining.

Not citing any definite figures about traumatic injuries in
the USSR, the author mentions that fatal injuries occur in the
open mines of all branches of industry, and most of them occur
in the open mines of the coal and metallurgical industries.

About 75 % of all fatal accidents happened because of the
violation of safety regulations, 15.1 % were due to cave-ins
and falling of coal, ore or rock lumps, and 8.6% were due to
faulty tools, etc.

TITLE: Breaking up rock with high-frequency currents 4 26

SOURCE: Stroitel'nyye materialy, no. 12, 1964, 9-11

TOPIC TAGS: structural mineral product, mining engineering, civil engineering

ABSTRACT: ~~It is shown that non-metallic rocks may be destroyed by hf~~
~~currents. The rocks are broken up without flying splinters and dust.~~
The method described may be used for quarrying and processing of non-
metalliferous structural materials both in open-pit conditions and at
the reception points of road construction sites. Calculations show that
the cost for breaking up the rock does not exceed 2.8 rub/m³ when
capacity of the installation is 28-30 m³/shift. The capacity of
the installation in laboratory conditions comes to approximately
m³/shift. It is hoped that an industrial installation may be
a capacity of up to 100 m³/shift which would bring the cost of
rock down to about 30 kp/m³.

AUTHORS: Shirokov, M. F., Vaulin, Ye. P., and Chesnokov, N. A.

TITLE: Some experiments to steady plasma flow in a homopolar

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 7, 1961, 802-805

TEXT: The authors studied the stream of an ionized gas in a homopolar (Fig. 1) at a pressure of $4 \cdot 10^{-1}$ mm Hg and in an external magnetic field of $H = 250$ oersteds. The magnetic field was parallel to the axis of the concentric cylindrical electrodes and perpendicular to the current density vector j . For the measurement of the velocity v , a rotary shaft was used, suspended on a thin thread (length $L = 10$ cm, radius $R = 1.25 \cdot 10^{-2}$ mm, torsion modulus $N = 6.5 \cdot 10^{11}$ dyne/cm²). Thin mica reeds of various width ($a = 0.2, 0.3, 0.4, 0.5, 0.7$ cm) and a length of $b = 4$ cm were fastened to the thin end of the shaft, perpendicular to the current. The mean velocity was obtained from the torques produced by the current and by the thread. The reed experiments made it possible to determine a maximum $a_m = 4$ cm,

Card 1/3

B108/B209

Some experiments to steady ...

at and below which the current pinch, due to the insertion of the reed, does not interfere with the velocity measurement. When the plasma stream is laminar, the current density through the cathode is connected with the stream velocity by the relation $\frac{j_1 H}{c} = \frac{45 \rho v^2}{2dR}$ (4); the ratio of the tube width to the cathode radius was $\frac{d}{r_1} = 0.67$; c is the resistivity coefficient, ρ - the density of the gas. In the case of turbulent flow, the above re-

lation has the form $\frac{j_1 H}{c} \approx \frac{0.3 \rho v^2}{R^{1/4} 2d}$ (5). Applying the logarithm to

these relations, one obtains $\log v = \log I - \log \left(\frac{45 c \eta S_1}{2d^3 H} \right)$ (6) for the laminar case and

$$\lg v = \frac{4}{7} \lg I - \frac{4}{7} \lg \left(\frac{0.3 c \rho^{3/4} \eta^{1/4} S_1}{2d^{1/4} H} \right), \quad (7)$$

Card 2/0 3

25026
S/057/61/031/007/007/021
B108/B209

Some experiments to steady ...

for the turbulent case, where $I = j_1 S_1$; S_1 - cathode area. For the laminar flow, a coefficient $c = \frac{10.2}{R_s}$ has to be used (Ref. 2: J. Schmiedel. Phys. Zs., 29, 593; 1938), where R_s is the Reynolds number of the reed in the stream. In the turbulent case, $c \approx 1$. The experimental results are in good agreement with the formulas for the turbulent and the laminar plasma stream, but considering that the Reynolds number $R_s < 2.5$, the flow has to be regarded as being laminar. There are 5 figures and 2 references: 1. Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Calculation of the particle evaporation process in a high temperature gas stream under non-adiabatic conditions

SOURCE: AN UkrSSR. Fizika goreniya (Combustion physics). Kiev, Izd-vo Naukova dumka, 1966, 70-84

TOPIC TAGS: plasma jet, metal powder, combustion, solid propellant, metal combustion, *POWDER METAL PRODUCTION, NONADIABATIC PROCESS*

ABSTRACT: Methods of producing ultrafine metal powders by injecting coarse powder into plasma jets have recently become of considerable interest. The heating, melting, and evaporation processes of the particles and important for the design of reactors. In the present study, an analysis was made of the melting and evaporation processes of metal particles in high-temperature plasma jets, and formulas were derived for calculating the time and path length required for melting and evaporation. Formulas for calculating the particle velocity during evaporation were also derived. Empirical and theoretical relationships are given for the temperature field in a cylindrical reactor into which an argon jet discharges. Orig. art. has: 40 formulas and 1 figure. [PV]

TITLE: Dependence of the precision of measurements on the amount of liquid remaining on the walls of viscometer reservoirs

SOURCE: USSR. Komitet standartov, mer i izmeritel'nykh priborov. Trudy institutov Komiteta. no. 62(122). Moscow, 1962. Issledovaniya v oblasti izmereniy vyazkosti, plotnosti i massy. 29-32.

TEXT: The amount of liquid left behind in a viscometer reservoir is liable to be different from that which was left behind during the original calibration. The previous work on this subject, which has given rise to contradictory results, is reviewed. Tests were made with some hundreds of bulbs in five different sizes which, for the purpose of the experiments, were connected to capillaries by rubber tubing. The amount of liquid left adhering to the walls after tests, under various conditions corresponding closely to those of practical viscometry, was

Card 1/3

Dependence of the precision of ...

S/589/62/000/062/003/011
E194/E136

determined by weighing. The relative amount of liquid remaining in spherical reservoirs was found to be independent of their volume, within the range 3.3-15 cm³ and the viscosity of petroleum products in the range 0.1-13 cst. The error that results from neglecting differences in the amount of liquid adhering to the reservoirs is not more than 0.05% for fluids having a viscosity of up to 1 cS, and is approximately 0.1% for fluids with viscosities in the range 1-13 cst. However, for pressure-viscometers the measurements on a given liquid under different rates of flow may differ by as much as 3%. The experimental data obtained are represented by the following approximate formula:

$$\frac{\Delta V}{V} = A + \frac{B}{\tau} \quad (4)$$

where: V - reservoir volume; τ - draining time, seconds; and A and B - constants having the following values for spherical reservoirs in the range 3.3-15 cm³ and flow times of 100-1000 secs.

TITLE: The limits of calibration constants of viscometers
having capillaries of different diameters

SOURCE: USSR. Komitet standartov, mer i izmeritel'nykh
priborov. Trudy institutov Komiteta. no. 62(122).
Moscow, 1962. Issledovaniya v oblasti izmereniy
vyazkosti, plotnosti i massy. 33-37.

TEXT: In the existing standard ГОСТ 33-53 (GOST 33-53)
capillary viscometers are characterized only by the nominal
capillary diameter. This specification is due for revision and
it would be better to characterize the viscometers by the
constants determined by the manufacturers. This would sometimes
necessitate changes in the method of defining manufacturing
tolerances and would also call for closer manufacturing tolerances.
It is important that viscometers of different nominal rating should
have different calibration constants. At present the manufacturing
tolerances for different capillary diameters overlap, so that the

Card 1/3

The limits of calibration constants ... S/589/62/000/062/004/011
E194/E136

calibration constants of instruments with nominally different capillary diameters also overlap. By way of example, the volume of liquid flowing in a Pinkevich standard viscometer is calculated with allowance for the usual manufacturing tolerances.

Calculations are then made of the influence on instrument calibration constant of variations in capillary diameter and length and bulb volume. In a particular case for a capillary of 0.6 mm diameter, 90 mm long and bulb volume of 3.5 cm³, capillary diameter tolerance can cause the constant to vary by about $\pm 30\%$, the bulb volume tolerance by about half of this value, and the capillary length tolerance by only $\pm 2\%$. Nominal minimum and maximum values of instrument constants for viscometers of different sizes are then calculated on the basis of existing manufacturing tolerances and the results are tabulated. The effect is then studied of decreasing the tolerances as follows: for capillaries of 0.4-1.2 mm diameter to ± 0.03 mm and for larger capillaries to ± 0.05 mm; for bulb volume to ± 0.3 cm³. These tolerances result in a clear distinction between the constants of viscometers

Card 2/3

The limits of calibration constants... S/589/62/000/062/004/011
E194/E136

with different diameters. It is recommended that the viscometer bulb should be specified in terms of volume rather than of linear dimensions, and minor design changes are suggested. The work described relates particularly to manufacturing conditions at the "Druzhnaya Gorka" Works.
There are 4 tables.

enough so that air can be drawn into the pipette during filling. In determining the kinematic viscosity it is currently recommended to take the density of the solution from the tables; however, it is more accurate to determine it each time. The tolerance of the test temperature of 20 °C should be reduced from $\pm 0.2^\circ$ to $\pm 0.1^\circ$. Sulphuric acid solutions which have been used for calibrating viscometers are not sufficiently viscous and should be replaced by petroleum-based calibrating fluids, provided by VNIIM, of such viscosity that the flow time during calibration is not less than 200 secs. The viscometer constants should be such that the test time with cellulose is at least 150 secs. It is best to avoid having the outflow tube in contact with the liquid surface in the receiver, as is recommended in the standard method, and to discharge to air.

There are 3 figures and 1 table.

TITLE: The viscosity of aqueous solutions of mineral salts

SOURCE: USSR. Komitet standartov, mer i izmeritel'nykh priborov. Trudy institutov Komiteta. no. 62(122). Moscow, 1962. Issledovaniya v oblasti izmereniy vyazkosti, plotnosti i massy. 44-51.

TEXT: A systematic study of the viscosity of aqueous solutions of a large number of mineral salts at 20 °C over a wide range of concentration is described. Three viscometers were used with capillaries of about 0.5 mm diameter. The repeatability was within 0.05%, at least ten repeat measurements having been made. The standard error of the determinations did not exceed 0.025%. Results are given for halides, nitrates, carbonates, sulphates, and phosphates of sodium, potassium and ammonium. It was found that the cations reduce the viscosity of water in the order $Na^+ > NH_4^+ > K^+$. For a given cation the anions reduce the viscosity in the following order:
Card 1/2

The viscosity of aqueous solutions... S/589/62/000/032/006/011
E194/E136

$PO_4^{''} > HPO_4^{''} > H_2PO_4^{'} > CO_3^{''} > HCO_3^{'} > SO_4^{''} > Cl^{'} > NO_3^{'} > BR^{'} > I^{'}$. Anomalous viscosity (i.e. less than that of water) is observed for potassium and ammonium chlorides, bromides, iodides and nitrates. Chlorides and nitrates of magnesium, calcium, strontium and barium were then examined. Taking the cations in order of viscosity, the highest first, they are: $Mg^{''} > Ca^{''} > Sr^{''} > Ba^{''}$. The greater the atomic weight of the element, the lower the viscosity of the solution. Salts of cobalt and nickel behave much like the others, i.e. nitrate solutions have lower viscosities than chloride solutions. Copper behaves similarly to the alkaline metals, i.e. the sulphate solutions are more viscous than the chloride solutions, which are more viscous than the nitrate solutions. Explanations that have been offered for the influence of mineral salts on viscosity are reviewed. It is concluded that the viscosity of aqueous solutions of mineral salts is influenced by both the cations and the anions, and that for salts which reduce the viscosity of water the influence of the cations preponderates. Nitrates of barium and lead reduce the viscosity of water. There are 10 tables.

TITLE: Characteristics of heat transfer in the channel of a sectional electric arc gas heater

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 10, no. 4, 1966, 508-512

TOPIC TAGS: heat transfer, electric arc, argon, heating

ABSTRACT: The experimental apparatus, shown in the article, has a tungsten cathode with a diameter of 10 mm, auxiliary and main anodes, and an intermediate section cooled with water. The ratio of the length of the channel to its diameter is equal to 8. The heater operates on direct current and its power is designed for 100 kilowatts; the working gas is argon. In the tests, the ranges of the parameters were between the following limits: argon flow rate, 1-3.7 grams/sec; pressure, 4×10^3 - 200×10^3 newtons/m²; power, 25-50 kilowatts; current strength, 300-700 amp; voltage, 70-120 volts; and, temperature of gas at outlet from channel, 10,000-13,000°K. Initial data and experimental data are shown in tabular form. On the basis of the experimental results the

following empirical expression was obtained:

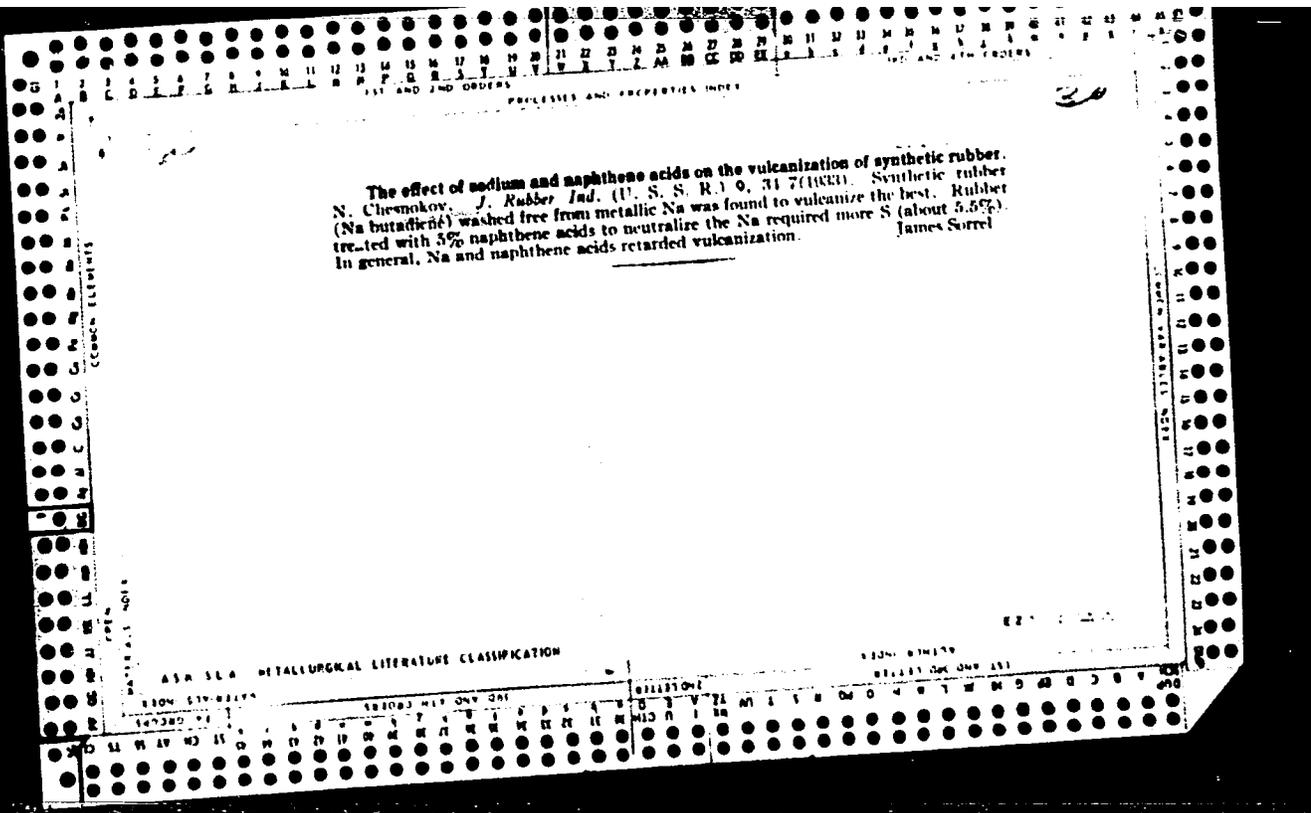

$$St = 0,7 Kn^{0,8}, \quad (2)$$

$$300 < Re < 1500; 0,002 < Kn < 0,06; 0,1 < M < 1,0.$$

This expression can be used for a qualitative evaluation of the effect of a decrease in pressure on the heat transfer rate in electric arc gas heaters with sectional channels, and for an approximate quantitative evaluation of heat transfer in similar electric arc heaters with a change of pressure in the system. Orig. art. has: 2 formulas, 2 figures and 1 table.

Utilization of diatomaceous earth in the rubber industry. N. Chomakov. *J. Rubber Ind. (U.S.S.R.)* 10, No. 1, 37-53 (1954). — Diatomaceous earths of Lovozersk, Krasnoyarsk and Kal'zhinsk produce rubber mixts. with resistance to tear and lower than mixts. with kaolin or chalk; they have considerably lower elongation than either chalk or barium mixts.; their resistance to abrasion is equal to kaolin mixts., and can be increased by roasting the earth. In chemite mixts., addition of roasted diatomaceous earth increases the hardness, brittleness, acid resistance and heat resistance, but shortens the breaking point when bent. Retilling improves the quality of the earths. They are not accelerators. Janice Sured
